# Phoenix User's Guide

**Figure 1: Phoenix introduction screen**

## Introduction

This section briefly describes how to install Phoenix and includes some basic information on how to use the program. More detailed information can be found in the Phoenix Help files. Each feature in Phoenix has its own Help file, which can be activated while running Phoenix. To activate a Help file while Phoenix is running, press the F1 key or the specific feature's Help button.

### General Setup Procedure

Initial installation of Phoenix requires the complete Phoenix installation package. This package, around 30 Megabytes in size, is provided on a CD-ROM disk. Because of this large size, it is not recommended to download the file nor is it practical to provide it on 3.5-inch floppy disks.

Initial installation of Phoenix requires the complete Phoenix installation package, which is around 30 MB. Because of its large size, Diego is provided on a CD rather than on a 3.5" floppy or as a download. To install Phoenix, follow the steps as outlined in the material that comes with the CD.

*Note: You MUST have a Nokia dongle installed on the computer prior to beginning the software installation.*

The Phoenix software is packaged into an executable bundle that allows you to double-click the executable to access the automatic installation program. Standard installation (i.e., selecting all of the default choices) is highly recommended. You may do a custom installation and place Phoenix into a special location on your hard drive, but this is only recommended for experienced users.

The installation process requires that you reboot the computer after installing the software. Phoenix is not usable until a reboot is completed. After the reboot, the Phoenix icon appears on the desktop. Double-click this icon to start the program.

### Hardware Requirements for Using Phoenix

**Table 1: Minimum Hardware Requirements**

| Hardware | Minimum Value |
|---|---|
| Processor | 233 MHz |
| RAM1 | 64 MB |
| Disk space needed | 50-100 MB |

**Table 2: Supported Operating System Information**

| Operating System | Notes |
|---|---|
| Windows 98 | SE only |
| Windows NT 4.0 | No USB support |
| Windows 2000 | Professional version |

## Installing Phoenix

Before installing the software, verify the following:

- The dongle is attached to the parallel port for PKD version dongles, or an FLS-4 version dongle is attached on either the parallel port or the USB port (if the computer supports USB).
- Ensure that if the computer supports administrator rights (typically on Windows NT and Windows 2000 installations) that access is enabled for the user performing the Phoenix installation.
- If a previous version of Phoenix has been installed, it may be necessary to first properly remove that program prior to installing the new version. If installation is performed, be sure to reboot the computer prior to continuing. See the "Uninstalling Phoenix" section for instructions on how to uninstall.

### Installation Instructions

Use the following steps to install Phoenix:

1. Insert the CD into the computer.
2. Navigate to the CD-ROM drive, and double-click the Phoenix software package.
3. Follow the on-screen prompts.
4. Reboot the computer when the installation is complete.

## Software Support Bundles

The Phoenix installation is auto-executable. You must obtain Software Support Bundles to load software upgrade files to customer-specific phone models. These bundles are created by Nokia Customer Care (CC) and made available by Nokia After Market Services (AMS) on the Partners Web Page http://americas.partners.nokia.com. This Web page is password-controlled; if you have not registered as a user, contact Nokia Central Service in Melbourne, Florida.

Similar to the Phoenix installation, these Software Support Bundles are *InstallShield* executable packages. Double-click on the package and it will install automatically.

No rebooting of the computer is required.

## Starting a Phoenix Session

### Concepts

When referring to Phoenix, *Product* is the cellular phone attached to the computer. Specifically, it is the particular type of phone.

*Connection* is the type of cable used to attach the phone and the port on the computer where it is attached. Refer to the *Service Tools* chapter for additional information.

The first time Phoenix is used, certain connection configurations must be made. Subsequent uses will rely on these selections and they will not need to be made again.

### Initial Session with Phoenix

It is necessary to create a connection the first time you use Phoenix. Use the following steps to create a connection:

1. Open the **File** menu and select **Manage Connections**.

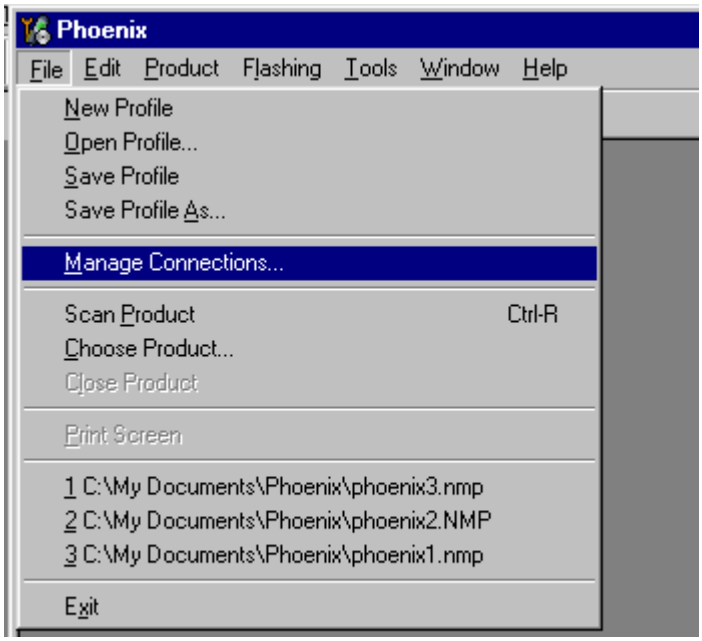

**Figure 3: File Menu with the Manage Connections option**

2. Click the **Add** button to create a new connection.

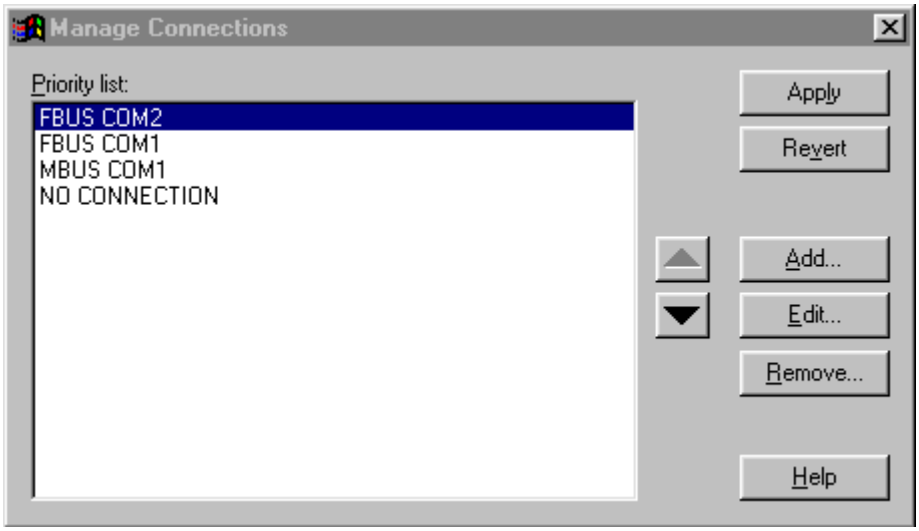

**Figure 4: Manage Connections dialog box**

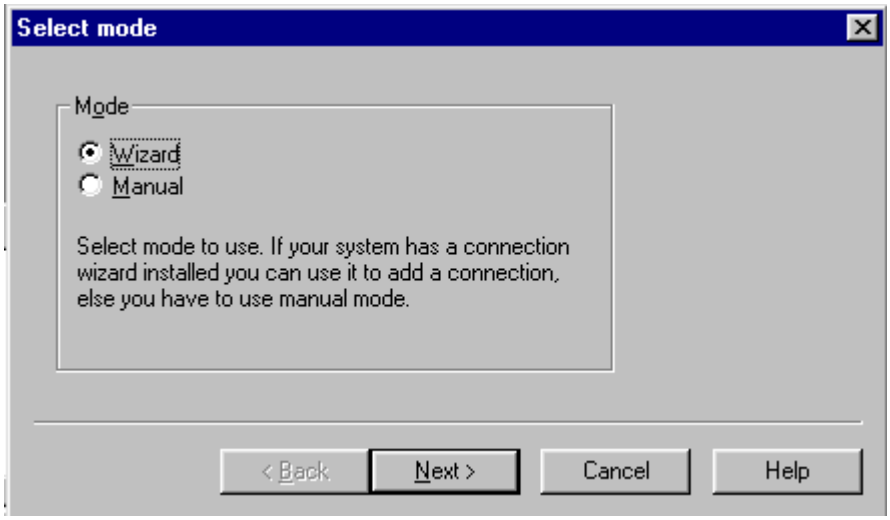
3. Choose one of the following on the **Select mode** dialog box:
   - Select **Wizard**, which allows Phoenix to auto-detect your connection configuration.
   - Select **Manual**, which allows you to manually select options to create the connection.



Select mode
Mode
Wizard
Manual
Select mode to use. If your system has a connection wizard installed you can use it to add a connection, else you have to use manual mode.

**Figure 5: Select Mode dialog box**

4. Once a connection is defined, make sure that the connection you want to use appears at the top of the list. If it does not, use the up and down arrows on the **Manage Connections** dialog box to move the connection to the top, and click the **Apply** button.
5. Close the window when you are finished.

   You can now proceed with the normal initiation of a session by selecting a product or scanning for a product.

### Scanning for a Product

Many features of this program are product-specific. Therefore it is necessary to configure Phoenix for the product on which you will be working at the beginning of the session.

Choose **Scan Product** from the drop-down menu list and Phoenix automatically scans for the product and selects the necessary configurations. The status bar at the bottom indicates if the product was found and its type.

### Using Components

When working with Phoenix, tasks are generally managed by specific software components. From the menu, select the desired component or task to be performed.

"Opening a component" is defined as opening a tool window within Phoenix. When this window is opened, Phoenix also opens a toolbar for it and adds component-specific menu items in the Window menu.

### Using Profiles

Phoenix's Profile feature allows product, connection, and currently open components to be stored into permanent storage by creating a profile file with a name of your choice followed by an *.nmp* file extension for later retrieval.

Saved profiles makes it easy to configure Phoenix into a desired configuration with favorite windows already opened and ready to go.

Opening and saving profiles is done via the **Open Profile** and **Save Profile** options in the **File** menu.

Profiles are stored into a disk file with user-defined names. As a result, there can be multiple profiles for different repeated tasks or user preferences.

## Uninstalling Phoenix

As mentioned in the "Installing Phoenix" section, it may be necessary or desirable to remove Phoenix. Care must be taken to follow this procedure. Failure to remove the program properly causes misconfiguration of the computer's registry.

### Uninstalling a Phoenix Version

Use the following steps to uninstall a version of Phoenix:

1. Navigate to the computer's Control Panel, which is accessible from the **Start** button or by double-clicking the "My Computer" desktop icon.
2. Double-click the "Add/Remove Programs" icon.
3. Select the Phoenix version that you want to remove, and click the **Add/Remove** button.
4. Click **OK** to begin the removal process.
5. Follow the on-screen instructions.
6. When the removal is complete, reboot the computer.
